

Stack (Multiple screen)

• push("/about")
→ ./about.js.

• push("/foldername/subfolder").
→ create index.js inside this that will be rendered on this route.

②

To change current screen

we do take help of stack
Stack \rightarrow RAM

we add new screen in stack
 \Rightarrow New screen in RAM

we do this using

`router.push("homeapfile")`

`router.back()`

\hookrightarrow to go 1 step back

remove current screen from stack

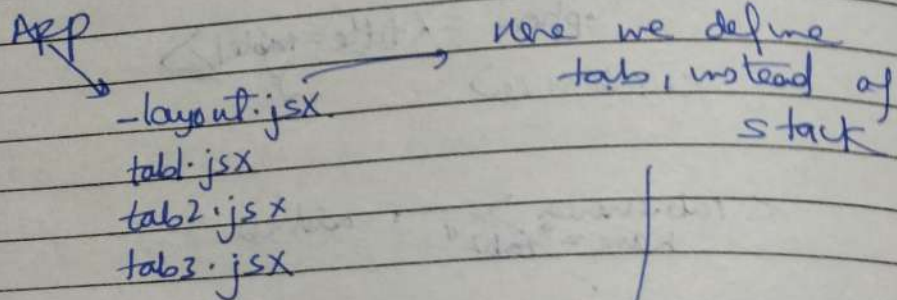

`router.replace("screenaddress")`

\hookrightarrow remove current screen from stack
& push this

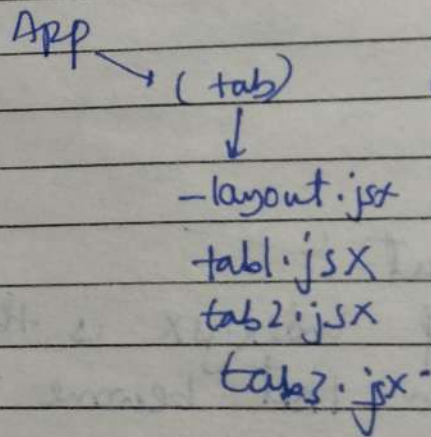

back button \Rightarrow `router.back()`

Tabs

① Screen with Multiple tab

or

(4)

- layout.jsx

DATE
PAGE

screen options here
<Tabs>

<Tab.Screen
name = "tab1" → tab1.jsx
options = <title = tab1 />
</Tab.Screen>

<Tab.Screen
name = "tab2" → address
:
:
: & so on.

</Tabs>

if there layout ✓
then if index.jsx is there
→ then that become main tab

else go
| tab1 → active main tab
| tab2
| tab3

⑤

DATE _____
PAGE _____

diff screen contain diff tag

App

layout (Stack widget)

index.js (main screen 1)

Screen 2 (screen 2.jsx)

How to add tabs in screen 3

3 tabs

Screen 3

T1
T2
T3

Screen 2.jsx

onpress routerpush ("screen 3 folder")

switching btw tabs
⇒ we won't lose any data of variable of that tab
on going back to screen: data of tabs get lost
on reopening tab: newly they get rendered.

⑥

App

↓ layout, screen1, screen2.js,

screen3 folder

→ layout → contains
tab config
writing
→ Tab1.jsx
→ Tab2.jsx
→ Tab3.jsx.

If any file is index.js
then that will be main tab

else in tab.screen

Top screen ⇒ main
screen
of tabs

Tip: No need for index.jsx inside Tabs

always

Tab1.jsx

Tab2.jsx

Tab3.jsx

& so on

MODALS

- for dialog box

models are there

very-very easy to use

REACT TOAST

- We also have toast for

messg for error & success

8 Drawer

let say screens - has a drawer.

- ① Create screens folder

- layout.jsx → write configuration for
gesture controlled drawer

These all
can be
accessed
from Drawer

{ index.jsx → main screens
file1.jsx
file2.jsx }
